Lesson 3: Creating Methods Inside a Class

Focus: Instance methods and object behaviour.

A student management system should not only store information but also perform operations on that information.

Exercise 3 – Adding Functionality to the Student Class

Continue developing the `Student` class.

Add the following methods:

A. `displayDetails()`

This method should display all the details of a student in a well-formatted manner.

B. `changeForm(newForm)`

This method should receive a new form as a parameter and update the student's current form.

C. `getFullName()`

This method should return the student's full name (first name and surname combined).

Questions

1. Add the three methods to the `Student` class.
2. Create a student object with your own test information.
3. Call `displayDetails()` to display the student's information.
4. Call `getFullName()` and display the returned value.
5. Use `changeForm()` to promote the student from Form 5 to Form 6.
6. Call `displayDetails()` again to confirm that the form has changed.
7. Create two additional students and perform the same operations on them.

Challenge question: Add a method called `changeAge(newAge)` that allows the age of a student to be updated.
