# Project: Student Management System

You have been asked to develop a simple system that stores and manages student information at a school.

By the end of the exercises, the system should be able to create student objects, store their details, record marks, calculate results, and manage multiple students.

# Lesson 1: Introduction to Classes and Objects

Focus: Creating a class, declaring attributes and creating objects.

## Exercise 1 – Creating a Student Class

Create a class called `Student`.

The class should have the following attributes:

- `name`
- `surname`
- `age`
- `gender`
- `form`

Questions

1. Define a class called `Student`.
2. Declare the five attributes listed above.
3. Create an object of the `Student` class called `student1`.
4. Assign the following information to `student1`:
    - Name: Thabo
    - Surname: Ndlovu
    - Age: 17
    - Gender: Male
    - Form: 5
5. Display all the information stored in `student1`.
6. Create a second object called `student2` and assign it information for a different student.
7. Display the information for both students.

Challenge question: Create a third student object. Can you store different information in each object even though all the objects were created from the same class?
