LESSON 3: Functions with Different Return Types

Focus: Integer, Double, String and Boolean return types.

Objective: Choose a suitable return type for a function based on the value it must return.

Exercise 10 – Calculating an Average

Create a function called CalculateAverage. It must accept three marks as parameters, calculate their average and return the average as a Double. Call the function and display the result to two decimal places.

Exercise 11 – Checking Even and Odd Numbers

Create a function called IsEven. It must accept an integer, return True if the number is divisible by 2, and return False otherwise. Test the function using at least five different numbers.

Exercise 12 – Checking Pass or Fail

Create a function called HasPassed. It must accept a student's mark and return True if the mark is 50 or above, otherwise return False. In Main, display an appropriate message based on the function's result.

Exercise 13 – Determining the Largest Number

Create a function called FindLargest. It must accept three integer parameters and return the largest number.

```
FindLargest(15, 40, 25)
'Expected return value: 40
```
