LOWER 6 ARRAY EXERCISE

Write a program that asks a user to enter the daily temperatures for a 7-day week (stored in a 1D array of size 7), and then performs the following tasks:

1. **Store and Display:** Read 7 integer or floating-point temperatures from the user and print them out in a clean weekly format.
2. **Calculate Average:** Compute and display the average weekly temperature.
3. **Find Extremes:** Identify and display the **hottest day** (maximum value) and the **coldest day** (minimum value) along with their corresponding day numbers (1 through 7).
4. **Count Above Average:** Count and display how many days had a temperature strictly greater than the weekly average.
