Lesson 2: Introducing Constructors

Focus: Initialising objects using constructors.

In the previous exercise, learners assigned values to the attributes after creating objects. In this lesson, they will learn how to initialise objects when they are created.

Exercise 2 – Improving the Student Class

Continue working with the `Student` class from Lesson 1.

Modify the class to include a constructor that accepts the following parameters:

- Student's name
- Student's surname
- Student's age
- Student's gender
- Student's form

Questions

1. Create a constructor that accepts the five parameters.
2. Use the constructor to initialise the attributes of the object.
3. Create an object called `student1` and pass the following values when creating it:

Attribute	Name	Surname	Age	Gender	Form
Value	Rudo	Moyo	18	Female	6

4. Create another object called `student2` with different information.
5. Display the information of both students.
6. Remove the statements previously used to assign values to the attributes individually. The constructor should now handle the initialisation.

Challenge question: Modify the constructor so that the `form` attribute has a default value of 5 when no form is supplied.
